# SOFTWARE DEPLOYMENT SERVICES

## MAINTAIN SECURITY AND COMPLIANCE STANDARDS WITH RELIABLE SOFTWARE DISTRIBUTION

Financial institutions are faced with many competing priorities, leaving little time to focus on the operational excellence details required to operate smoothly and securely. Software Deployment Services are designed to automate the management and implementation of software patches across the entire self-service fleet, saving time and resources. Unlike many providers in the industry today, Diebold Nixdorf's Software Deployment Services suite encompasses the entire software stack, not just the operating system.

Software Deployment is a managed service that keeps your software stack up-to-date, so your self-service fleet remains secure, efficient and available. With Diebold Nixdorf working behind the scenes with remote software distribution capabilities, we enable continuous security, compliance and uninterrupted availability.

### SOFTWARE DEPLOYMENT INCLUDES:

- Remote deployment and removal of the operating system, applicable third-party software, and terminal application software ensuring fast and efficient updates.
- Ongoing monitoring of available updates, hotfixes, manufacturing releases and service packs for self-service devices.
- Pre-testing of software updates against the factory software images prior to deployment for greater accuracy and maximum reliability.
- A customer portal that provides an audit trail of all deployments within the self-service fleet.
- Protection from existing security threats and rapid response to emerging vulnerabilities.
- Adherence to compliance standards as outlined in relevant industry mandates.
